Pass to the Floor · Gunda

What the tool can do for a live-casino studio — and why it is better than running the floor on spreadsheets, chat groups and separate tools

One tool for every department that moves a person from hiring to the gaming floor and keeps them there: **Academy, Performance, FMD (scheduling), Uniforms, HR, Office (building access and IT) and Service Management**, plus Projects and staff chat. Every employee also gets their own page on the phone.

At a glance

One place Every department, every employee, one shared list of people	**Live** A change is seen by everyone who needs it, on screens, phones and lobby TVs	**Controlled** Each person sees only what their position allows — enforced by the server	**Proven** 45 automated test files and thousands of clicked screens, no errors

What it can do

Scheduling and the floor (FMD)

- Builds the monthly schedule and the half-hour **table rotation** for a whole shift with one button. With more people than tables, every table is always covered and breaks are shared fairly.
- **Shufflers** rotate over zones (groups of tables) that follow the teams' tables automatically.
- When someone is **sick, late or leaves early**, the rest of the shift is re-planned in one step; people who are off today can be called in; **mentors** on standby cover any table.
- A **Today** screen tells the shift lead who is where now, who is on a break, where a table is uncovered and what the next gap is — plus a **written handover** to the next shift with a read receipt.
- Employee requests (swap, give away, leave, sick, day off) get an **automatic rules check** — rest time, hours, leave balance, minimum cover — and approving one updates the schedule.
- Pay per shift or per hour, bonuses, month review and a ready **Excel payroll workbook** for the payroll system.

Training and quality (Academy, Performance)

- Onboarding groups with spreadsheet-style sheets, workshop and exam checklists, scoring one by one, in pairs or as a grid.
- Printable **barcode ID cards** and signature logbooks generated from the same employee list.
- Evaluations with photos and videos, results, retraining, coaching follow-ups; results can be shared with the employee with written feedback.

People and HR

- One employee list for everyone, filled from **Microsoft Dynamics 365** or Excel — matched by HR ID, nothing removed by accident, full change history per person.
- Recruiting pipeline, life-cycle records, and work types such as **Termination** that open the right tickets in HR, building access, uniforms and IT at once.
- Policies and procedures with **versions and "I have read it" confirmations** — the owner sees who has not confirmed.

Every department

- A ticket **board** with assignees, due dates, comments and escalation; a dashboard, documents, history and an overview page.
- Uniform stock with issue and return; service incidents with Jira import and reports; cross-department **projects** with a timeline; staff **channels and chats**.

Employees on their phone

- Their own schedule, rotation, requests, evaluations shared with them, pay statements and vacation days left — and nothing about anybody else.
- One tap to confirm a new schedule, or to report "I am sick / late / leaving early". Installs like an app.

Lobby screens

- Live rotation on TVs: now and next, the whole shift, or every team at once; and a free-layout **information board** that also works on TVs mounted sideways.

Why it is better than spreadsheets, chat groups and separate tools

Usually today	With PTF · Gunda
A schedule in one spreadsheet, the rotation in another, changes announced in chat	One schedule and rotation; employees and TVs see changes live and confirm they saw them
A sick call means rebuilding the rotation by hand	The shift is re-planned in one step; uncovered tables are shown at once
Requests by message; rules checked from memory	Requests arrive in one place with an automatic rules check and update the schedule when approved
Each department keeps its own copy of the employee list	One list for everybody, fed from HR, with the history of every change
A leaver is handled by separate e-mails to each department	One Termination case opens every task and shows what is still open
Handover by phone or chat, nothing kept	Written handover saved with the shift summary and a read receipt
"Please read the new procedure" — no way to know who did	Versioned documents with confirmations and a "who has not" list
Everybody can open everything, or nobody can	Access per position and per person; the server decides what each person receives
Pay prepared by hand from the schedule	Pay calculated from the shifts actually worked and exported as an Excel workbook

Built to be trusted

- **Access is enforced by the server**, not just hidden on screen: tickets, cases, pay and evaluations reach only the people allowed to see them.
- **Company sign-in** with Microsoft Entra ID in the Server Edition; data stays on the company server, nothing is left on laptops.
- **Safe on shared computers**: Sign out removes everything, and a new person never sees the previous person's data.
- **Nothing is lost**: two people editing at once are merged, every change is in the history, and backups can be restored.
- **Scales**: tested with more than 1,000 employees in one schedule and a load test of 5,365 people across 4 locations.
- **Honest about its limits**: it prepares data for the payroll and HR systems instead of replacing them, and never shows a connection as working when it is not.
